TITLE: "Structural Contributions" to the Values of Second Derivatives
of the Thermodynamic Potentials of Liquids

PERIODICAL: Zhurnal fizicheskoy khimii, 1960, Vol 34, Nr 1, pp 168-176
(USSR)

ABSTRACT: Simple thermodynamic relations expressing the so-called "structural contributions" to compressibility (Table 1, Figs 1-4), thermal expansion, and specific heat (Table 2, Figs 5 and 6) are used here in the form of second derivatives of entropy with respect to volume, pressure, or temperature. The numerical values of these derivatives were computed according to experimental data for a number of liquids with different character of the intermolecular interaction as well as for liquid mixtures: acetone - chloroform (Fig 7), acetone - carbon disulfide (Fig 8), benzene - ethylene dichloride (Fig 9), and benzene - carbon tetrachloride (Fig 10). The authors discussed their relation to the molecular structure of liquids. Structural contributions and the compression values of liquids are easily

related to the expansion degree of liquids. In the case of liquid mixtures, their calculation offers positive data on changes of structure taking place in the intermixture of liquids. I. N. Godnev and Ya. I. Frenkel' are also mentioned in this paper. There are 10 figures, 2 tables, and 26 references, 7 of which are Soviet.

TITLE: Thermodynamic functions of an anharmonic oscillator and a vibrating rotator

PERIODICAL: Referativnyy zhurnal, Fizika, no. 11, 1962, 11, abstract 11V69
("Spisy přírodověd. fak. univ. Brně", 1962, v. 26, no. 1, 19 - 35;
summaries in English and German)

TEXT: A method is proposed for calculating statistical sums of an anharmonic oscillator and a vibrating rotator. For the vibrating energy levels a relation is introduced which contains 4 constants; taken into account are the limitation of the vibrating and rotating levels, the interaction of the vibration with the rotation, and the influence of the centrifugal force at the rotation. The approximation used permits to obtain, in the entire temperature range of the given tables, the same accuracy of calculation (within three decimal digits) as in the case of direct summation. The tables may be applied up to temperatures determined by the relation $1.4388 \omega/T > 0.4$. For most two-atom molecules this corresponds to temperatures up to 3,000°K.

TITLE: RC generator with high stability and linearity

SOURCE: Izmeritel'naya tekhnika, no. 4, 1966, 57-60

TOPIC TAGS: generator, Hall effect, rf oscillator, frequency stability, linear system

ABSTRACT: The generator (Fig. 1) was developed for use in Hall-effect measurements and to provide good frequency stability, precise frequency setting, low intermodulation distortion, amplitude stability, high output voltage, and low output impedance. A Wien-bridge circuit is used. Its characteristics are defined in terms of the equivalent Q at resonance. The influence of different types of asymmetry of the frequency-dependent Wien-bridge arms on the effective Q is analyzed and the factors governing the design of the input, output, and amplifier circuits of the generator are discussed. The generator has two working frequencies, 20 and 70 cps, a tuning range $\pm 10\%$, a setting accuracy $\pm 0.15\%$, and a frequency stability $\pm 0.025\%$. Its output (stable within $\pm 2\%$) at ~ 2 ohms is 100 v. The overall linear distortion coefficient is $\approx 0.002\%$. It is

pp 74 - 76 (USSR)

ABSTRACT: A detailed diagram of the amplifier is shown in Figure 1. The device consists of three identical selective stages whose centre frequencies are slightly shifted with respect to each other. Each stage is based on a cascode circuit connected in a twin-T symmetrical feedback path. The input signal applied to the system is first amplified by the cascode section of the input tube. Since the control grid of the cascode stage is large, the adjustment of each RC filter of each section of the input tube. In order to secure a uniform gain in the passband, the feedback of each stage is adjusted by means of the resistors R_{10} , R_{24} and R_{38} . The cascode arrangement adopted in the system \checkmark

A Selective Low-frequency Amplifier Having a Narrow Rectangular Frequency Response

is very stable and insensitive to the changes of the tube characteristics and tolerances of the components. By adopting a stabilized power supply it was possible to avoid the interstage decoupling networks. The overall gain of the system is 5×10^6 and its bandwidth is 1 cps, the centre frequency being 20 cps. The amplification is constant to within 3% over the passband. The overall frequency characteristic of the amplifier is shown in Figure 2. The author expresses his indebtedness to V. Tolutis for his constant interest in this work and for discussing the results. There are 2 figures and 8 references, 3 of which are English and 5 Soviet.

TITLE: Combined investigation of thin layers of cadmium telluride. V. Some methodological problems in investigation of the Hall effect in thin high-resistivity semiconductor layers

SOURCE: Akademiya nauk Litovskoy SSR. Trudy. Seriya B, no. 1(28), 1962, 73-84

TEXT: This paper is continuation of the combined investigation of thin layers of cadmium telluride (see Parts I-IV). Difficulties in measurement of the Hall effect using alternating electric and magnetic fields are discussed. This method has been described by S.R. Russel and C. Mahling (Rev. Sci. Instr., 21, 1028-29, 1950), J.L. Levy (Phys. Rev., 92, 215-120, 1953) and Ya. Dushek (Czechosl. J. Phys., no. 9, 250-255, 1959). The difficulties are: 1) instability of the electric (f_E) and the magnetic (f_H) field frequencies which make the difference frequency $f_X = f_E - f_H$ also unstable, 2)

Card 1/3

Combined investigation ...

S/236/62/000/001/006/007

D207/D307

instability of the amplification factor of the narrow-band amplifier which is used to select f_1 ; 3) appearance of signals with frequencies f_2 and f_H at the amplifier input and in the sample giving rise to unwanted signals; 4) high noise level of the Hall probes; 5) shunting action of the stray capacitance of the amplifier input. These and less important difficulties are dealt with briefly and circuit modifications are suggested for their elimination. The maximum sensitivity of the authors' apparatus was limited by the thermal noise of the input impedance and was represented by the carrier mobility (determined from the Hall effect) of $4 \times 10^{-3} \text{ cm}^2 \cdot \text{v}^{-1} \text{ sec}^{-1}$ which was obtained for sample resistances up to 10^8 ohm . The apparatus can be used for measurement on samples of up to 10^{12} ohm resistance when the sensitivity falls to $10 \text{ cm}^2 \cdot \text{v}^{-1} \text{ sec}^{-1}$. At all the sample resistances up to 10^{12} ohm the authors' apparatus had a sensitivity higher than that of other apparatus described in literature. There are 6 figures.

Title : About complex metal halide - alcohol compounds

Periodical : Izv. AN SSSR, Otd. Khim. Nauk., 3, 470 - 477, May - June 1954

Abstract : The products derived from the reaction between halides of certain metals, belonging to the second and third groups of the D. I. Mendeleev periodical system of elements, and aliphatic and cyclic alcohols, are described. The number of alcohol molecules in various metal halide-alcohol combinations, is outlined. The dependence of the complex metal halide-alcohol compounds upon the reaction conditions and the chemical nature of the metal halides, is explained. Seventeen references: Eleven USSR, 3 USA and 3 French.

✓ Contact-catalytic alkylation of benzene in the presence of zinc chloride, deposited on aluminum oxide, under conditions of elevated pressure. N. I. Shufkin, A. B. Kuchukov, and N. A. Pordinayev (N. D. Zelinskii Inst. Org. Chem., Acad. Sci. U.S.S.R., Moscow), *Izvest. Akad. Nauk S.S.R., Otdel. Khim. Nauk* 1954, 934-10. — Alkylation of C_6H_6 by means of Et_2O , $Et(OH)_2$, or $HO-PrOH$ in vapor phase at elevated pressure was achieved by contact with $ZnCl_2$ deposited on Al_2O_3 . With Et_2O a 41-3.5% yield of crude $EtPh$ is obtained (based on Et_2O) at 20 atm. and in the range of 250-400°. At 300° an increase of pressure from 20 atm. to 60 atm. results in a moderate increase of alkylate. At 300-50° and 20 atm. with a C_6H_6/Et_2O ratio of 4.5-1 to 6-1 there is obtained a crude cut of $EtPh$ amounting to 74-86% yield based on Et_2O or 13-14% based on C_6H_6 . Alkylation with C_6H_6 gives 16% yield (based on C_6H_6) at 300°, 40 atm. and 2:1 reagent ratio; the catalyst contains, besides $EtPh$, some $MePh$ and $C_6H_5Et_2$ (15.4% σ , 46.2 π , and 38.1% ρ). $iso-PrOH$ is most effective at 300-50° and at 20-40 atm. yields $iso-PrPh$ in 60.3% yield (based on the alc.). TITLE:

Alkylation of anthracene with alcohols in the presence of zinc chloride

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 24, 1962, 350 - 351,
abstract 24Zh252 (Uzb. khim. zh., no. 2, 1962, 51 - 56)
[summary in Uzb.]

TEXT: Anthracene (I) was alkylated with iso-C₅H₉OH (II) and iso-C₅H₁₁OH (III) in the presence of ZnCl₂ under various conditions. Alkylation with amounts of α -butyl-I (Ia), 2,6-dibutyl-I (Ib), tributyl-I (Id). Alkylation of I with III yielded 2,6-diamyl-I (Ie). The position of the alkyl radicals in Ie was confirmed by their oxidation to alkylanthraquinones by means of CrO₃ in glacial acetic acid when heated. Further oxidation of the alkylanthraquinones to the corresponding anthraquinone-carboxylic acids by means of ENO₃ in

Alkylation of anthracene with ...

sealed tubes definitely confirmed the position of the alkyl radicles in Ia-e. The influence of the quantitative ratios of the reactants and of temperature upon the yields of Ia-e was studied. The optimum reaction temperature is 145 - 160°C; at higher temperatures (170 - 190°C) the product resinified. The reaction requires an excess of alcohol, as the latter is partly lost in the form of olefins, and because an excess of it acts as a solvent for I. 5 moles of $ZnCl_2$ were used per mole of I; more $ZnCl_2$ brought about resinification of I. 0.5 moles of $ZnCl_2$ were dissolved under stirring in 4-6 ml of boiling II, and a suspension of 0.1 mole of I in II (altogether 1 mole of II was used) was added during HCl bubbling in portions of 2-3 ml each, and heated to 155-160°C for 3.5 - 4 hrs with violent stirring. After standing for 24 hrs, it was decomposed with water, neutralized with petroleum ether. The crystalline residue A, insoluble in petroleum ether, was filtered and washed with petroleum ether until the color disappeared. The combined petroleum ether extracts were washed with water until neutral reaction occurred. The residue left after evaporation of the petroleum ether was distilled in vacuo, with separation into three fractions: Boiling ranges 70-140°C/10 mm Hg, 140-255°C/5 mm Hg, 255-295°C/5 mm Hg. The latter two fractions were distilled once more at Card 2/4

S/081/62/000/024/045/073
B106/B186

Alkylation of anthracene with ...

5 mm Hg, and gave the following fractions: Boiling ranges 140-205, 205-210, 210-240, 240-250, 250-260, 260-270, 270-295°C. Ia, $C_{18}H_{18}$, m.p.

133-134°C was isolated from the first two fractions by recrystallization repeated 14 times; picrate m.p. 178-180°C. Oxidation of Ia with CrO_3 in CH_3COOH under heating gave α -butylanthraquinone, $C_{18}H_{16}O_2$ (IV), m.p.

91-92°C (from glacial acetic acid). Oxidation of 0.6 g IV with 20 ml HNO_3 (d 1.1) in the course of 11 hrs at 220-225°C gave α -anthraquinone-carboxylic acid, m.p. 294-295°C, identified by the qualitative reaction described by N. Krasovskiy (see ZhRKhO, v.46, 1914, 1070). Ib, $C_{22}H_{26}$, m.p.

252-253°C, was separated from the fractions with boiling ranges 210-240 and 240-250°C, and from the crystalline residue A after washing it out 14-15 times with a mixture of boiling petroleum ether and alcohol; picrate, m.p. 182-193°C. Oxidation of Ib with CrO_3 in CH_3COOH gave 2,6-dibutyl-

anthraquinone, $C_{22}H_{24}O_2$ (V), m.p. 159-160°C (from glacial acetic acid).

Oxidation of V with HNO_3 gave anthraquinone-2,6-dicarboxylic acid, m.p. 460°C (decomposition). Ic, $C_{26}H_{34}$, m.p. 153-155°C, was separated from the

Card 3/4

Alkylation of anthracene with ...

S/081/62/000/024/045/073
B106/B186

fractions with boiling ranges 250-260, 260-270 and 270-295°C by recrystallization from petroleum ether and then from alcohol; picrate, m.p. 176-179°C. Ic is oxidized by CrO_3 in CH_3COOH to give tributylanthraquinone, $\text{C}_{26}\text{H}_{32}\text{O}_2$, m.p. 144-145°C. Oxidation of a fraction with boiling range 140-295°C with CrO_3 gave anthraquinone, m.p. 283°C; this fraction obviously contained small amounts of Id. In the same way 0.1 mole of I was alkylated with 1 mole of III in the presence of 0.5 moles of ZnCl_2 . In this reaction only the crystals insoluble in petroleum ether (corresponding to residue A in the previous experiment) were studied. They proved to be Ie, m.p. 248 - 249°C. Oxidation of Ie with CrO_3 in CH_3COOH gave 2,6-diamylantraquinone (VI), m.p. 171-172°C (from glacial acetic acid). Oxidation of VI with HNO_3 yielded anthraquinone-2,6-di-carboxylic acid, m.p. 460°C (decomposition). [Abstracter's note: Complete translation.] ✓

TITLE: Quantitative spectroscopic determination of silica in soluble organosilica compounds

SOURCE: AN SSSR. Komissiya po analiticheskoy khimii. Trudy*. v. 13, 1963
Organicheskiy analiz, 159-165

TOPIC TAGS: spectroscopy, silica, ethanol, o-xylol, cobaltous chloride

ABSTRACT: A spectroscopic method for the determination of silica in organosilica compounds without their prior chemical decomposition has been developed. The conditions for the analysis must be that the temperature of the electrode containing the sample must be low in order to avoid evaporation. The electrode must have a porous base. The introduction of the internal standard into the liquid organic compound presents a certain problem since the salts of metals in most cases are insoluble in organic liquids. This problem was solved by dissolving these salts in polar organic solvents before mixing them with the organosilica compounds. The system investigated in our experiment as an organic solvent was 96% ethanol and o-xylol. The solubility of CoCl₂ in 96% ethanol-o-xylol mixture was also

Card 1/2

L 12637-63

ACCESSION NR: AT3002345

investigated. The homogeneity of the sample is one of the main factors affecting the accuracy of the analysis. The concentration of the internal standard must be equal for all samples in relation to the amount of sample. The samples must be freshly mixed with the solvents before analysis. The absolute alcohol in the mixture will hydrolyze with water from the air upon standing and it will result in great errors. The experimental results with some monomeric and polymeric organosilica compounds gave results with relative accuracies of plus or minus 10%. The silica content in the organic material must not be less than 1%. Orig. art. has: 4 tables and 2 graphs.

ORG: Moscow Chemico-technological Institute im. D. I. Mendeleyev
(Moskovskiy khimiko-tehnologicheskiy institut)TITLE: Quantitative determination of titanium in titanium-organic and
titanium-silicon-organic compounds

SOURCE: Zhurnal analiticheskoy khimii, v. 20, no. 12, 1965, 1325-1329

TOPIC TAGS: quantitative analysis, titanium, titanium compound, silicon
compound

ABSTRACT: The article describes two methods for the determination of titanium, a titration (complexometric) and a spectroscopic method. In the titration method, a weighed portion of the compound to be analyzed, containing 10-15 mg of titanium, is introduced into 5-7 ml of concentrated sulfuric acid. The mixture is heated for 10-15 minutes up to the evolution of H_2SO_4 vapors. The solution is cooled to 90-100° and complete mineralization of the weighed portion is carried out with ammonium persulfate. The solution is cooled and 30 ml of water are

Card 1/2

UDC: 543.70:543.80

L 58113-66

ACC NR: AP6014141

carefully added and the solution is boiled for 5-10 min to decompose the ammonium persulfate. The silicic acid is filtered off and the silicon is determined by weighing in the form of SiO₂. Final titration of the titanium in the filtrate is done with a 0.05 M solution of ZnSO₄. The relative error of the method does not exceed 2.5%. In the spectroscopic method, the titanium is determined in the form of tetrabutoxytitanium and silicon in the form of tetraoxysilane.¹ In this method, the standard relative error in the determination is 2.2% for titanium and 4% for silicon. Comparative results by the two methods are shown in tabular form. According to the article, the spectroscopic method is to be preferred in practice, since no preliminary mineralization is required. Orig. art. has: 2 figures and 2 tables.

TITLE: Accelerated methods for determining aluminum and silicon in organic compounds containing aluminum and silicon

SOURCE: Lakokrasochnyye materialy i ikh primeneniye, no. 3, 1966, 60-62

TOPIC TAGS: heterocyclic compounds; aluminum determination; silicon determination;
~~TRIMETYL, ALUMINUM COMPOUND, SILICON COMPOUND, CHEMICAL DETERMINATION,~~
~~SPARK IGNITION~~

ABSTRACT: Current methods for determining Al and Si in Al- and Si-containing organic compounds (ASOC) require complete mineralization of such compounds and are time-consuming. The authors have developed two accelerated methods for determining these elements in ASOC. The first method is the determination of aluminum by titration involving complex ion formation. The $\rightarrow\text{Si}-\text{O}-\text{Al}\left|\right.$ bond is hydrolyzed with a 2N aqueous solution of HCl in acetone or methanol medium. The $\rightarrow\text{Si}-\text{C}\leftarrow$ bond is not affected under these conditions. The organic solvents contribute to the fast hydrolysis by readily dissolving and stabilizing the hydrolysis products. Titration is conducted in aqueous-methanol or aqueous-acetone solutions. The titrant is zinc sulfate; the indicator is Xylenol Orange or dithizone. The second method is spectroscopic for simultaneous determination of aluminum and silicon involving spraying of ASOC cumene solutions into a low-power spark discharge. The two methods were verified with ASOC

| Card 2/4

L 29728-66

ACC NR: AP6019449

of known composition. Both methods give reproducible results which are in general agreement with those of the gravimetric method. Accuracy of the first method is from -1.50 to +0.91%; accuracy of the second method is: for Al, from -2.98 to +3.15%; for Si, from -4.8 to +3.8%. The procedures are described in the source. Orig. art. has: 1 figure and 2 tables.

TITLE: Absorption-structural properties of modified natural sorbents
from the volga region

SCURCE: AN BSSR. Vestsi. Seriya khimichnykh nauk, no. 3, 1966, 22-28

TOPIC TAGS: mineral, adsorption, / Lower Volga region, Central Volga region

SUB CODE: 08,07

ABSTRACT: The Lower and Central Volga regions abound in natural sorbents such as diatomites, tripoli earths, opokas. In this connection the authors investigated the effect of calcining temperature on the adsorption properties of specimens of these minerals, which also were subjected to radiographic, chromatographic, and other tests. It was established that the applicability of these natural sorbents may be widened if they are subjected to proper types of treatment such as chemical activation with acids to increase pore volume and to increase the number of hydroxyl groups at the surface of the activated specimens. These hydroxyl groups are chemically active sites with respect to the adsorp-

131. Additional losses in frequency regulation.
M. D. KRAUS AND E. M. ROVNER, *Elektricheskie
Sistemy na Sverkhvysokich Frekvenciyakh*, Institute of
Electrical Engineering, USSR Academy of Sciences, Moscow, 1954.

The loading of a frequency-regulating generator will fluctuate about the hourly average values determined by the dispatcher's daily load diagram. Specific fuel consumption of these units and transmission losses will be greater in operation with a variable average load \bar{P} and frequency regulation than those corresponding values for operation at a constant load P_0 . These losses, which can be analyzed by the method of specific moments, must be considered in planning a frequency-regulating system (i.e., analysis to be based on periods of operation when no transient thermal or dynamic processes occur). This analysis carried out makes the reduction of the regulating losses by increasing the number of frequency-regulating power stations. This measure also reduces the number of standby frequency-regulating reserves in every station and brings the mean loading close to its optimum value. If the number of frequency-regulating stations is considerable, this also reduces the regulations in all the stations approximately to the level of those at present connected with the operation of the speed governor. Lastly, a reduction of the losses due to thermal and dynamic transient processes is obtained.

TOPIC TAGS: hydroelectric power plant, electric engineering personnel

SUB CODES: 10

ABSTRACT: B. S. Uspenskiy was born in June 1905. He graduated from the State Electric Machine Building Institute in 1928 as an electric installation engineer. He worked in the State Electro-Technical Trust for four years, then in the All-Union ElectroTechnical Union, where he planned power construction units. Plans which he made up at that time for the electrical portion of electrical stations and sub-stations are still being used. He was involved in planning and installation of the electrical portion of hydro-electric power stations and powerful pumping stations in the Moscow-Volga Canal. During the war, he was in charge in installation of the Krasnogorskaya Heat and Electric Power Station, the planning of the Urals Hydro-Electric Power Station and other projects. No
